ASSIGNMENT 1

PAYMENT CALCULATOR FOR A VILLAGE MILK CO-OPERATIVE

Task 3: Choose Variables and Name the Constants

Aim: To identify suitable variables and constants for the village milk payment calculator.

Variables: Variables store values that can change for each milk delivery. Examples include `farmer_id`, `litres`, `fat`, `snf`, and `shift`.

Constants: Constants store fixed values used in the calculation. Examples include `BASE_RATE`, `BASE_FAT`, `BASE_SNF`, `FAT_ADJUSTMENT`, and `SNF_ADJUSTMENT`.

Data types: Farmer ID and shift are stored as strings. Milk quantity, fat percentage, SNF percentage, and payment-related values use `Decimal` to support accurate decimal calculations.

Conclusion: Meaningful variable names improve readability, while named constants avoid repeating fixed values throughout the program. This makes the calculator easier to maintain when milk rates change.
